Data representation

Wikipedia

- Large
 - Up to several GB
- Time-dependent
 - Many timesteps
- Multivariate
 - Velocity
 - Pressure
 - Temperature
 - Strain
 - ...

➔ Need for analysis tools

Raw Data

- Visualization of raw data
 - Glyphs & color coding
 - Volume rendering
 - Texture advection

Kirby 99

Svakhine 05

Jobard 01

Telea 03

- Useful for
 - Small scale and local phenomena
 - Turbulence, shock waves, ...

Flow Features

- Flow features
 - Vortices and shear layers
 - Vector field topology
 - ...

Balabanian 08

Kasten 09

Schafhitzel 11

- Useful for
 - Data overview
 - Domain-specific tasks (optimization, fault detection, ...)

Integral structures

Wikipedia

Integral curves

- Integral curves
 - Streamlines
 - Path lines
 - Streak lines
 - Time lines

Wikipedia

Darelius 08

Wikipedia

- Useful for
 - Investigating time-dependent phenomena
 - Trajectories, mixing, transport, ...

Integral surfaces

- Integral surfaces
 - Stream/path surfaces
 - Streak surfaces
 - Time surfaces

Bürger 09

Krishnan 09

- Improve depth & shape perception
- Emphasize relation between curves

Integral surfaces

- Main problem: **cluttering** & **self occlusion**

Integral surfaces

- Main problem: **cluttering** & **self occlusion**

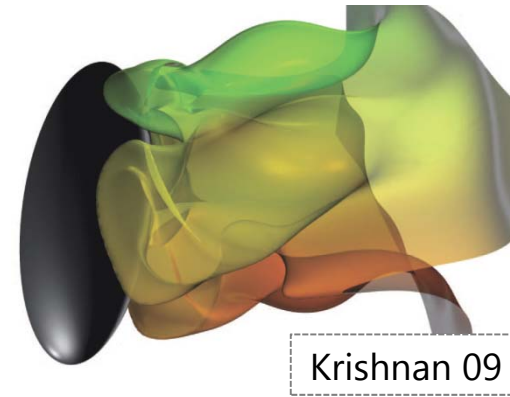

Multiple surfaces

Integral surfaces

- Main problem: **cluttering** & **self occlusion**

- Visibility issues can be addressed
 - Before integration -> seeding curve selection
 - After integration -> shading, cuts, deformations

Visibility Management

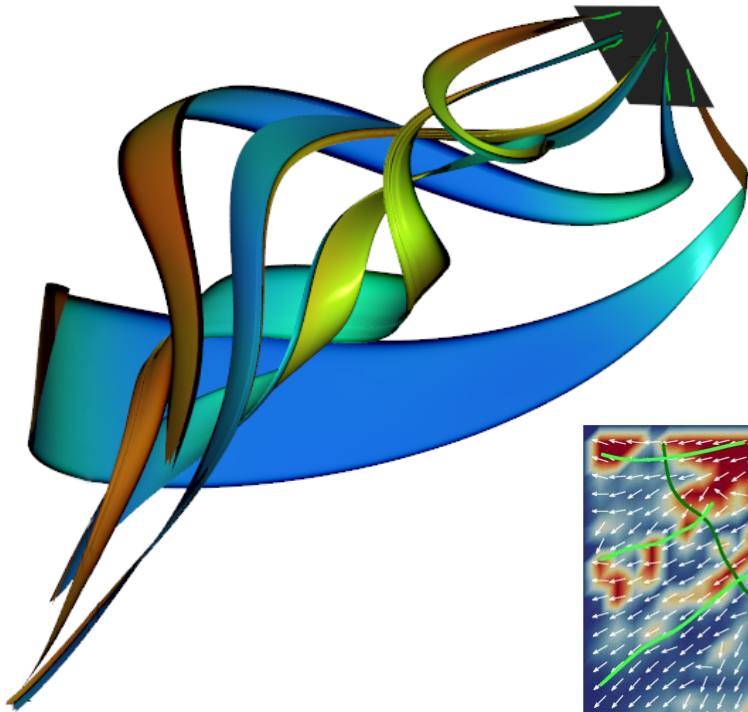

Similarity-based seeding

Integral surface flattening

Visibility Management

Similarity-based seeding

Integral surface flattening

Integral Surface Placement

- How can we define a proper seeding structure?
 - Use a line segment -> 6 degrees of freedom
 - Use an arbitrary curve -> ... a lot
 - Seed multiple surfaces -> even more!

- Goal: define a semi-automatic seeding strategy s.t.:
 - Handle multiple surfaces
 - Captures the most prominent aspects of the flow
 - Each surface capture a single aspect of the flow

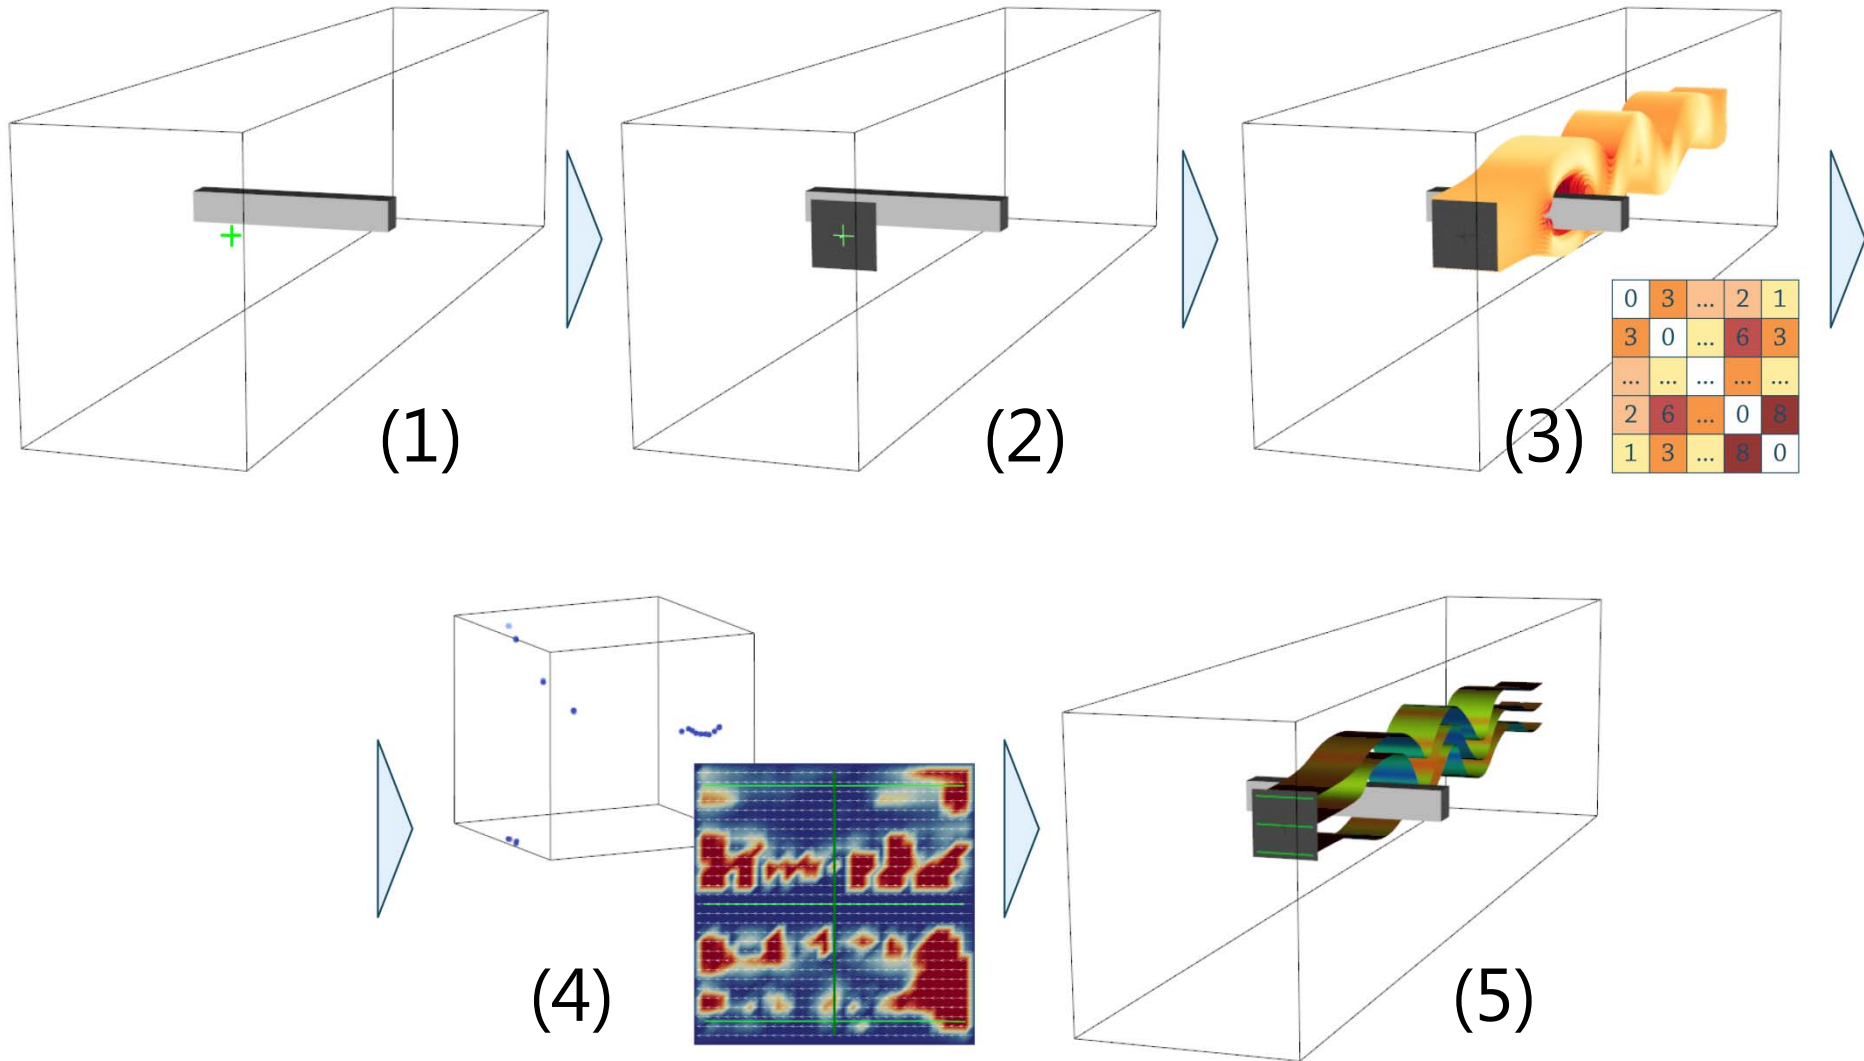

Multiple Aspects of a Flow

Multiple Aspects of a Flow

Placement Pipeline

Dissimilarity and MDS

- Dissimilarity given by the Hausdorff distance
 - Expensive, so compute it on the GPU
 - Other dissimilarity measures can be used

- Multi Dimensional Scaling: embed points in R^N according to their reciprocal similarity
- Computed on the GPU using CFMDS (Park et al '12)

Derivatives and Seeding

- Each point $\mathbf{P} = (u, v)$ is mapped by the MDS to a point $\mathbf{X} = (x_0, x_1, \dots, x_N)$ in the embedding space

- The derivative $\mathbf{J} = d\mathbf{X} / d\mathbf{P}$ is a $N \times 2$ matrix
- We compute the eigendecomposition of $\mathbf{J}^T \mathbf{J}$
- Eigenvectors are the directions of max/min similarity
- We use tensor lines of the min eigenvector field as seeding curves

Visibility Management

Similarity-based seeding

Integral surface flattening

Integral Surface Analysis

- We want to investigate the long-term flow behavior
- We adopted (families of) integral surfaces as a tool

- Now we aim at easing their analysis

Integral Surface Analysis

- Surfaces can have intricate shapes
 - Analysis of one surface at a time
 - Extensive user interaction / manipulation
 - Flow properties not easily conveyed
- We take advantage of **surface reformation**
- Ad-hoc visualizations in the reformed space

Surface Reformation

- As-Rigid-As-Possible flattening (Liu et al. '08)
- Maps surface points $\mathbf{X} = (x, y, z)$ to points $\mathbf{P} = (u, v)$ in the 2D reformed space
- The original shape should be still conveyed!

- Compute the matrix $\mathbf{J} = d\mathbf{X} / d\mathbf{P}$
- Compute the eigendecomposition of $\mathbf{J}^T \mathbf{J}$

Flow Attributes on Surfaces

- Scalar attributes can be directly mapped to colors
- Vectors and tensors needs to:
 - be projected on the surface
 - take flattening into account

$$\mathbf{S}_\psi = (\mathbf{I} - \mathbf{nn}^T) \mathbf{S} (\mathbf{I} - \mathbf{nn}^T)^T$$

$$\mathbf{S}_2 = \mathbf{J}^{-1} \mathbf{S}_\psi \mathbf{J}$$

Vorticity

Strain rate

- Size \leftrightarrow $\|\mathbf{S}_\psi\|$ Color \leftrightarrow $\|\mathbf{S}_\psi\| / \|\mathbf{S}\|$

Families of Time Surfaces

Families of Time Surfaces

- Alignment by least square optimization
- Color & transparency depending on scalar attribute

Multiple Surface Families

Multiple Surface Families

Multiple Surface Families

Final Remarks

- Integration-based visualization is a powerful tool for flow analysis
- Effectiveness limited by visibility issues
- Addressed visibility for either single or families of surfaces
- There is still a lot to do!
 - No approach solves all the issues
 - Integration of different analysis tools
 - Multiple spatial scales
 - ...
