

# Interactive Story Telling for Presentation with Visualization

**Helwig Hauser**

University of Bergen, Norway  
[www.i.i.UiB.no/vis](http://www.i.i.UiB.no/vis)

## Visualization – what for?

- **General definition:**  
**Visualization** = utilizing **computer graphics** technology to enable **insight** into **data**
- **Task categories:**
  - visualization for **exploration / analysis**
    - exploration: detecting the unexpected
    - analysis: confirming/rejecting hypotheses
    - interactive visual information drill-down
    - visualization as expert tool
  - visualization for **presentation**
    - presentation: communication of findings to others
    - ranging between static and interactive graphics
    - includes visualization for “the masses”
    - special requirements wrt. **comprehensibility**, **credibility**

## Some State of the Art

- How to present?  
(esp. wrt. interactive visualization)
  - images (with labels!)
  - animations
  - semi-interactive graphics
  - interactive graphics

[VRVis (Mroz...)]

[VRVis (Mroz...)]

[Hamburg (Höhne...)]

[Magdeburg (Preim...)]

## The Basic Idea (EuroVis 2007)

- Improve comprehensibility
  - **challenge/problem:**  
loaded vis. results difficult to (fully) understand
  - **approach/solution:**  
preserve the creation of a visualization result  
(not only the final picture)
- Improve credibility
  - **challenge/problem:**  
„sink or swim“ visualization  
(„believe it or ...“)
  - **approach/solution:**  
enable the interactive reinvestigation on demand  
(diminish disbelief)

## Sample Story

- Analysis of a tripod fracture...

# Overview

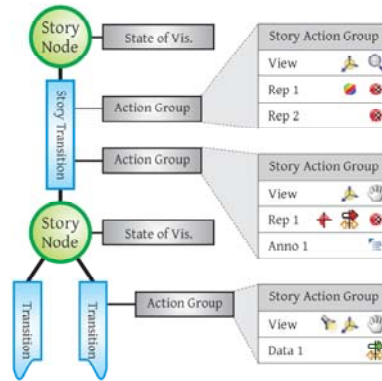

- Visualization stories
- Story telling and interaction
- Sample story
- Story authoring, implementation

## Story Model

- From **story node** to **story node** (cf. keyframe anim.),
  - usually the story stops here for a moment
  - usually nodes are annotated
- via **story transitions**,
- which are composed of **action groups**,
- that join **actions** together which should be done in parallel

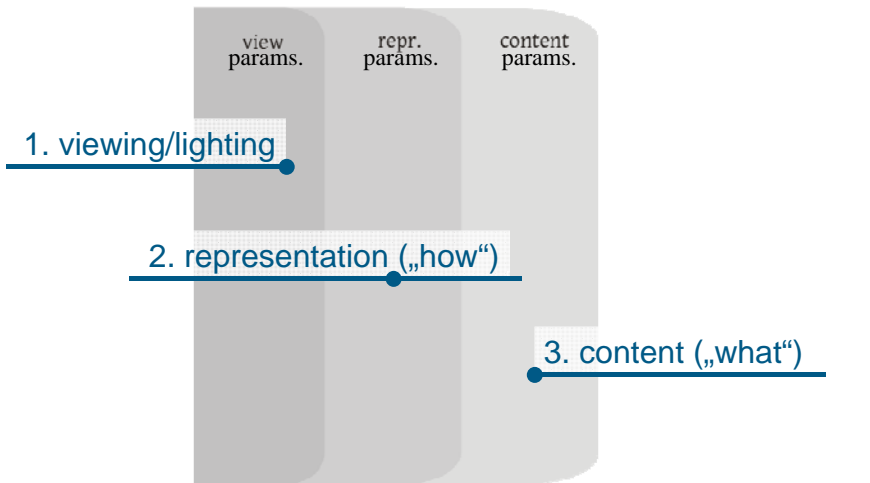

## Sample Story Templates

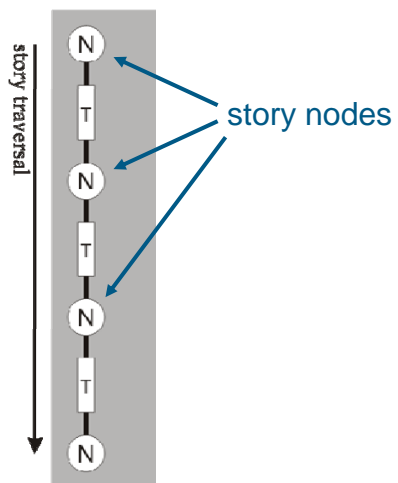

- Information drill-down (à la Shneiderman et al.)
  - overview first
  - zoom & filter
  - details on demand
- Comparative visualization
  - e.g., left side vs. right side (symmetric datasets)
  - e.g., pre-operative vs. post-operative (multiple datasets)
- Iterative investigation
  - feature set traversal (FORALL features DO visualization)
  - cf. lymph nodes visualization [Krüger et al., EuroVis '05]

## Three Layers of Interaction in Visualization

## Story Layout

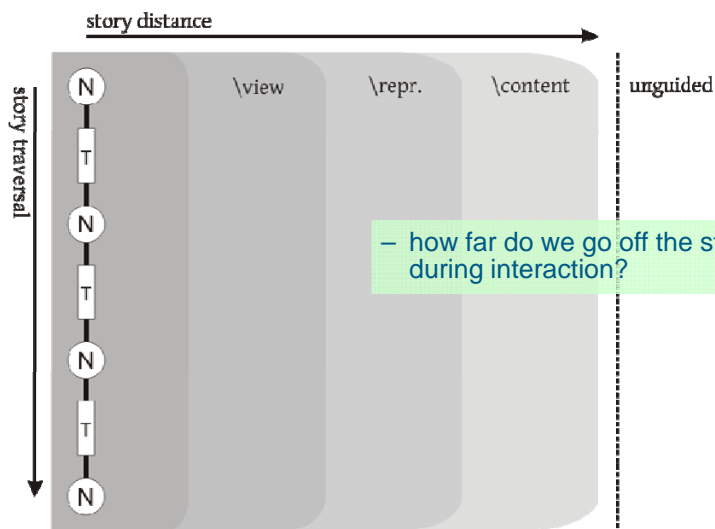

## Passive Story Consumption

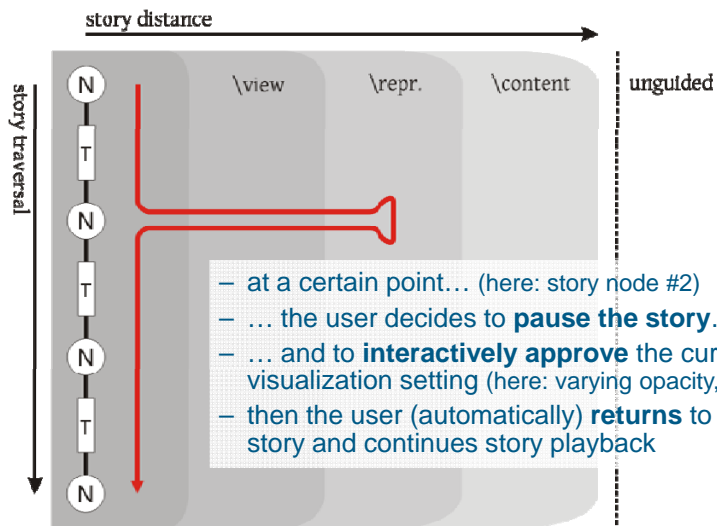

- default configuration, no interaction
- the story is consumed **like an animation**

## Story Telling and Interaction

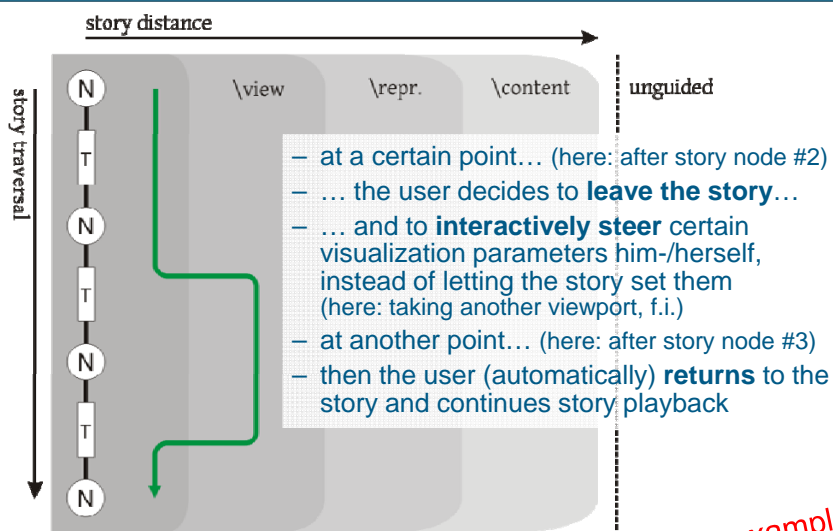

## Story Playback with Interactive Approval

*example*

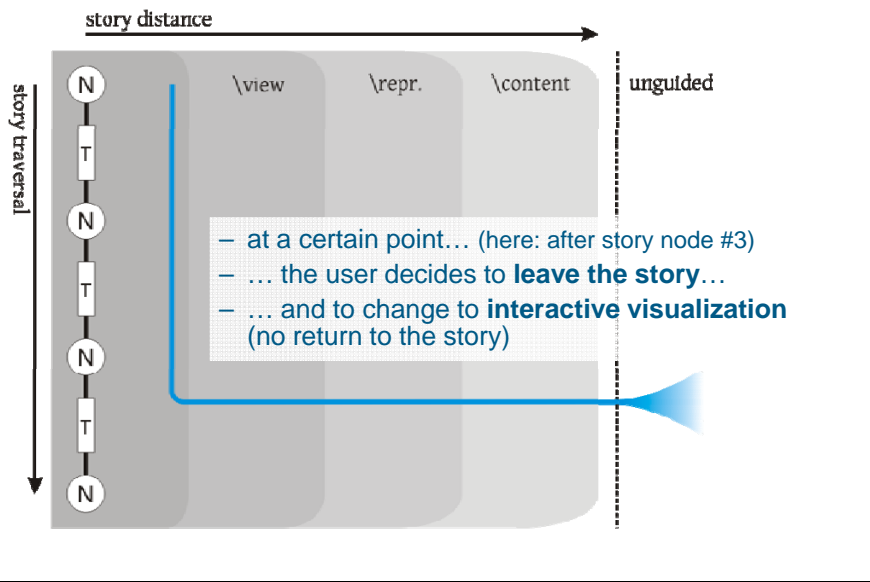

## Semi-Interactive Story Playback

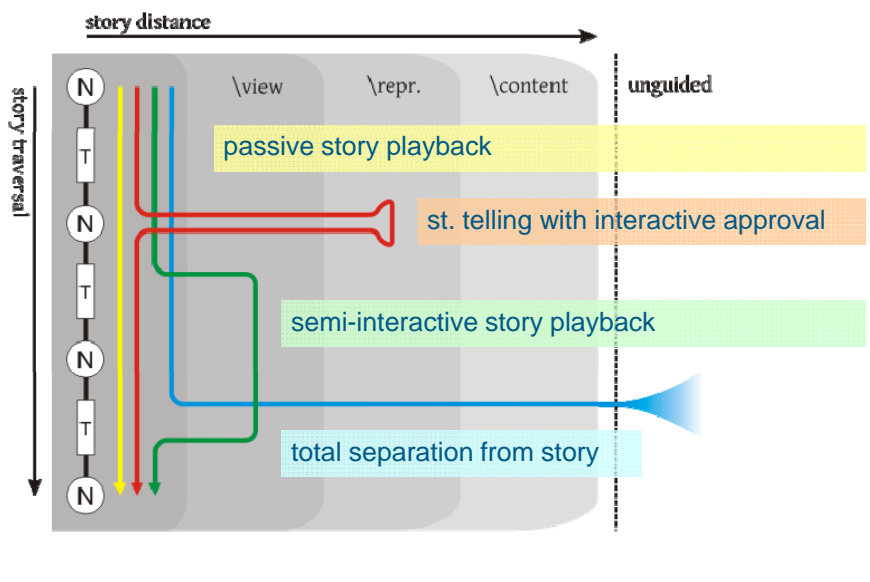

*example*

## Total Separation from the Story

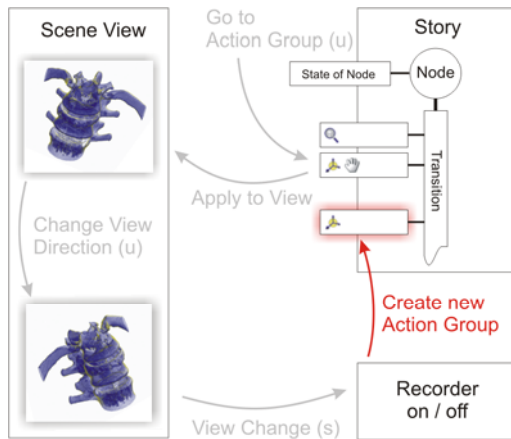

## All Four Interaction Patterns

# Story Authoring

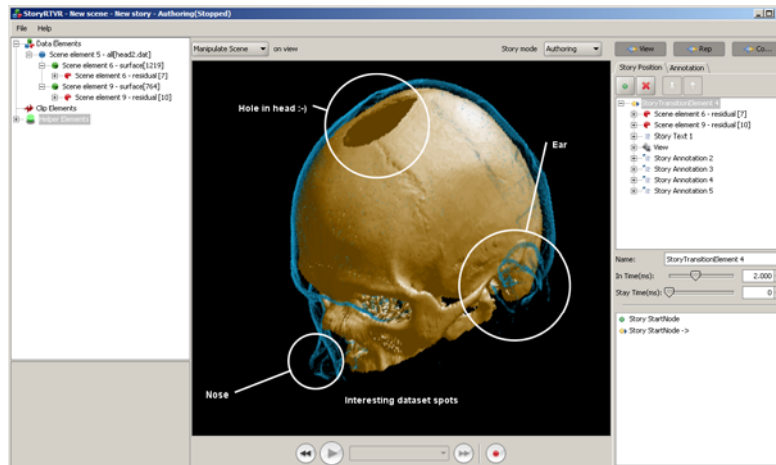

## ■ Story generation, then story editing

# Implementation

## ■ Based on RTVR (Java)

## Story Telling for Presentation

- New approach to improve
  - comprehensibility
  - credibility
- Presentation relevant (often costly)
- Semi-interactive visualization
  - guided interaction (if interaction at all)
  - adapts to user preferences
- Future opportunities
  - automatic export of reports
  - delayed / remote cooperation (joint analysis)
  - documentation

## Acknowledgements

- **Michael Wohlfart** (did his Master on all this)
- **Lukas Mroz** – RTVR, support, much more! ;-)
- **The Meister!**
- **Ivan Viola, Stefan Bruckner** – very valuable input!
- **Bernhard Preim, Knut Hartmann** – great exchange!
- ***You!*** for your attention!
  
- **Kplus.at** for funding – very important! ;-)
